LAB – 2 - Agile Backlog Creation & Sprint Simulation in Jira

Name: Prajin Ravi Shankar

SRN: PES1UG24CS328

Section: 5-F

Project: Public Bus Live Tracking (project title #24)

Jira Project Link:

4. Reflection

1. Did your estimations reflect the actual effort?

Yes, the story point estimates were generally appropriate for the expected effort and complexity of the work. The simpler stories were assigned lower values such as 3 points, while more complex functionality such as real-time ETA calculation, crowding estimation, and ETA deviation detection

were assigned 5 points. Both planned sprints were completed successfully, suggesting that the estimates were reasonable for the simulated workload.

2. Was your backlog well-prioritized?

Yes. The backlog was prioritized according to the importance of the system's core functionality. High-priority stories focused on essential commuter features such as searching for routes, viewing real-time bus locations, calculating ETA, and estimating crowding. Medium-priority stories focused mainly on fleet monitoring and historical analysis. This ensured that the most important user-facing functionality was addressed first.

3. How did your simulated sprint align with your plan?

The simulated sprint followed the planned backlog structure. **Sprint 1 contained 3 stories worth 13 story points**, and all three were completed. **Sprint 2 contained 6 stories worth 24 story points**, and all six were also completed. The work therefore progressed from the core live-tracking functionality in Sprint 1 to crowding, fleet monitoring, and historical-data functionality in Sprint 2.

4. What insights did the burndown chart give about your team's capacity?

The Sprint 2 burndown chart showed the remaining work decreasing from **24 story points to 0**, indicating that the planned sprint workload was completed. The chart helped visualize progress against the ideal guideline and showed that the team was able to complete the committed work within the sprint. This suggests that the team's simulated capacity was sufficient for the 24-point Sprint 2 workload.
